Abstract—There is no standard method on how to carry out Indoor Radio Frequency (RF) coverage assessments in 3G and 4G mobile networks. Random methods are preferred by RF engineers when performing measurement campaigns. Unfortunately, in indoor environments, these random methods are usually limited to assessing RF coverage around the internal contours of buildings. The above methods are exposed to several shortcomings such as the geographical occupancy of the space and the size of samples collected. The Special Drive Test Route (SDTR) method was introduced and works better than these random methods. Even though the SDTR is better as compared to random methods, it is not perfect. For instance, this method has limitations in choosing the direction of the route and the spacing between routes. This paper focuses on Square SDTR and provides strategy to overcome the limitations of the SDTR method, in order to give RF engineers a more reliable way to assess indoor RF coverage in 3G and 4G mobile networks. As a result, spacing between axes should not exceed 1.5m to get more reliable results and in 67% of studied cases, more samples could be collected by carefully choosing itinerary path direction.

Brice A. Elono graduated as a Design Engineer in Telecommunications in 2014 from “Ecole Superieure Multinationale des Telecommunications” (ESMT), Dakar, Senegal. He is a PhD student in Telecoms at ESMT, Dakar, Senegal since 2017 and currently a research associate at National Committee for Development of Technologies (CNDT), Yaounde, Cameroon. His research covers IoT, IP Networks security, Wireless Communications Systems, Big Data analysis, Business Intelligence and Mobile Networks QoS

Ahmed D. KORA is IEEE senior member. He is graduated in ICT Engineering in 2003 from “Ecole Superieure Multinationale de Telecommunications” (ESMT),Dakar, SENEGAL. He received his Ph.D. degree in telecommunication from the University of Limoges, France, in 2007. He is promoted as full professor by the regional accreditation institution (CAMES) and currently the Director of Teaching, Trainings and Research at ESMT. His research area covers QoS/QoE, network radio coverage, fiber optic transmission system, communication and networks system architecture, open network management solutions, universal access, low cost IT systems for development, etc

Thierry J. Fotso Wabo graduated as Design Engineering Degree in Telecommunication with Network and Mobile Services in 2014 as specialization from the “Ecole Superieure Multinationale des Telecommunications” (ESMT), Dakar, Senegal. He is a skillful and experienced innovative engineer with more than five years of experience handling all aspects of wireless (2G, 3G, 4G and VSAT) and PSTN, NGN Class4, FTTH, ADSL and ISDN technologies in East, West and Central Africa. He worked in diverse Wireless QoS projects with MNOs and regulators. Currently, he is a Technical Account Manager at MNS Consulting, Dakar, Senegal. His research covers IoT, 5G, Small Cells, and QoS in Mobile Networks.
