Abstract—To protect the services and data of the main servers, Rapidly Deployed Cyber Attack Bait is proposed for the unpredictable cybersecurity attack in this research. Based on Software Defined Network, the data packet and operation of a cybersecurity attack could be redirected to the on demand deployed bait container. By suitable artificial intelligence strategy, the idle bait containers corresponding to the type of cybersecurity attack can be on demand deployed automatically and rapidly. Verification shows the feasibility of the virtualized bait container could be about 1.16 times to 2 times enough for the future coming attacker and also record the all operations of the cybersecurity attack individually.

Keyword—cybersecurity, bait, Software Defined Network, Artificial Intelligence, container

Ming-Shen Jian was born in Kaohsiung City, Taiwan in 1978. He received the B.S. from the National Chiao Tung University, HsinChu, and Ph.D degrees in Computer Science and Engineering from the National Sun Yat-sen University, Kaohsiung, Taiwan in 2007. From 2018, he was an Associate Professor and director with the National Formosa University Cloud Computing and Intelligent System Laboratory. Currently he is also an IEEE Senior Member.. His research interests include IOT development and application, Big Data, Optimal Solution, Intelligent System, and Cloud Computing. He was a Secretary of the Taiwan Association of Cloud Computing.

Bo-Yi Lee is a Ph.D. candidate in the Department of Information Management at National Sun Yat-sen University and has served as a senior engineer at the National Center for High-Performance Computing. He possesses extensive experience in various fields, including cyber security architecture design, malware analysis, and intrusion detection. His primary research interests focus on network threat detection through data-driven threat intelligence and machine learning techniques.

Yong-Qing Hsieh currently is a bachelor degree student of Dept. Computer Science and Information Engineering at National Formosa University. Her current research interests are in the area related to artificial intelligence and cybersecurity. She joins the Cloud Computing and Intelligent System Lab. (CCIS Lab.) from 2023.

Chun-He Cheng currently is a bachelor degree student of Dept. Computer Science and Information Engineering at National Formosa University. His current research interests are in the area related to artificial intelligence and Docker container services, digital twins, and IoT system. He joins the Cloud Computing and Intelligent System Lab. (CCIS Lab.) from 2022.

Xing-En Liu currently is a bachelor degree student of Dept. Computer Science and Information Engineering at National Formosa University. His current research interests are in the area related to Cloud Computing and Docker container services, security, and intelligent system. He joins the Cloud Computing and Intelligent System Lad. (CCIS Lab.) from 2022.

Rui-Lun Cai currently is a bachelor degree student of Dept. Computer Science and Information Engineering at National Formosa University. His current research interests are in the area related to Cloud Computing and Docker container services, and security services. He joins the Cloud Computing and Intelligent System Lad. (CCIS Lab.) from 2022.

Pei-Cen Liao currently is a bachelor degree student of Dept. Computer Science and Information Engineering at National Formosa University. Her current research interests are in the area related to security and Docker container services, and intelligent bait system. She joins the Cloud Computing and Intelligent System Lad. (CCIS Lab.) from 2023.

Ta-Yuan Chou received the Ph.D. degree at the department of computer science and engineering, National Sun Yat-Sen University, Kaohsiung, Taiwan, R.O.C in 2008. He is an assistant researcher in National Center for High-Performance Computing. His doctoral research mainly focuses on evolutionary computation, multiobjective optimization, and scheduling problems. His current research interests include various open networking technologies, such as software defined network, and P4 programming.

Wun-Yuan Huang received his BS degree in Information and Computer Engineering from Chung Yuan Christian University, Taiwan, in 2006, and his MS degree in Computer Science and Information Engineering from National Dong Hwa University, Taiwan, in 2009. He is currently an associate researcher at the National Center for High-Performance Computing. His primary research focuses on SDN, threat deception, and the deployment of honeypots.
